Title: Yunnan Takes Lead In Producing Safety Cigarette  
Location: China

TMA News 6-Apr-2000  
ASIF

The Yunnan Provincial Research Institute on Tobacco has announced that its unique research findings, the newly-developed j°Hongyuntianj± and j°Pingguo Xiang Wangj± safety cigarettes, will be sold on the market soon.

Smoking and health is a issue which is cared by the whole society. All countries have carried out studies centering on how to improve the safety of smoking. Through one year of efforts, scientists of the Yunnan Provincial Research Institute on Tobacco developed two trademarks of safety cigarettes. For a long period of time, people have judged the safety of cigarette with three quotas of tar level, nicotine and carbonic oxide, which are incomplete. One example is that the harmful elements in tar account for only 0.6 percent, and the rest 99.4 percent is harmless. The research institute has created a set of scientific evaluation system. It uses Puleiye, a natural plant preparation, to greatly reduce the harmful biological active in the smoke of cigarettes, and several natural plant elements, which are unique in Yunnan, to check the growth of nitroso compound and other micro-harmful elements in the smoke thus greatly improving the safety of cigarettes. With an approval of the state authoritative departments, the two trademarks of cigarettes have reached the standard of safety. Enditem
